Will be invoked from logger service if  
any force close happens

Maill<sup>[12]</sup>

## 2.3 Description:

### [1] MainActivity:-

- It is a splash screen.
- Click 'START' enter inside tool.

### [2] CustomListViewAndroidExample:-

- It lists all the installed apps in the device.
- "logger" service will be started to track force close.

### [3] logger:-

- It is a service running in the background.
- It constantly collects system logs and check if any app force closes.

### [4] Router:-

- You can choose either to test application or record inputs.
- **Record:** It takes you to record choices for recording inputs.
- **Test:** It takes you to tester to starting testing from databases.

### [5] Tester:-

- It checks if any databases present under **sdcard/<package name>**
- If any databases present it lists them all.
- Click on any list item to see content of database file.
- Click on "**start**" button to launch selected application and starts "**ghost**" service.

### [6] Ghost:-

- It is a service to launch selected application and continuous inputs read from databases are injected into targeted application.

### [7] RecordChoices:-

- It lists options to either "**manual**" or "**automatic**" recording of inputs into the database.

[8] Manual:-

- Enter new database name in the EditText box.
- Click “save” button to create database with the name specified in text box.

[9] Automatic:-

- Enter new database name in the EditText box.
- Click on “start recording” button to launch selected application and starts “**recorder**” service.

[10] Recorder:-

- It is a service running in the background writes the input given by the user into the database

[11] ManualList:-

- It lists all the inputs in the selected database.
- “Green Plus” button is to insert a new input (key or touch).
- “Red Minus” button is to delete an input.

[12] Mail:-

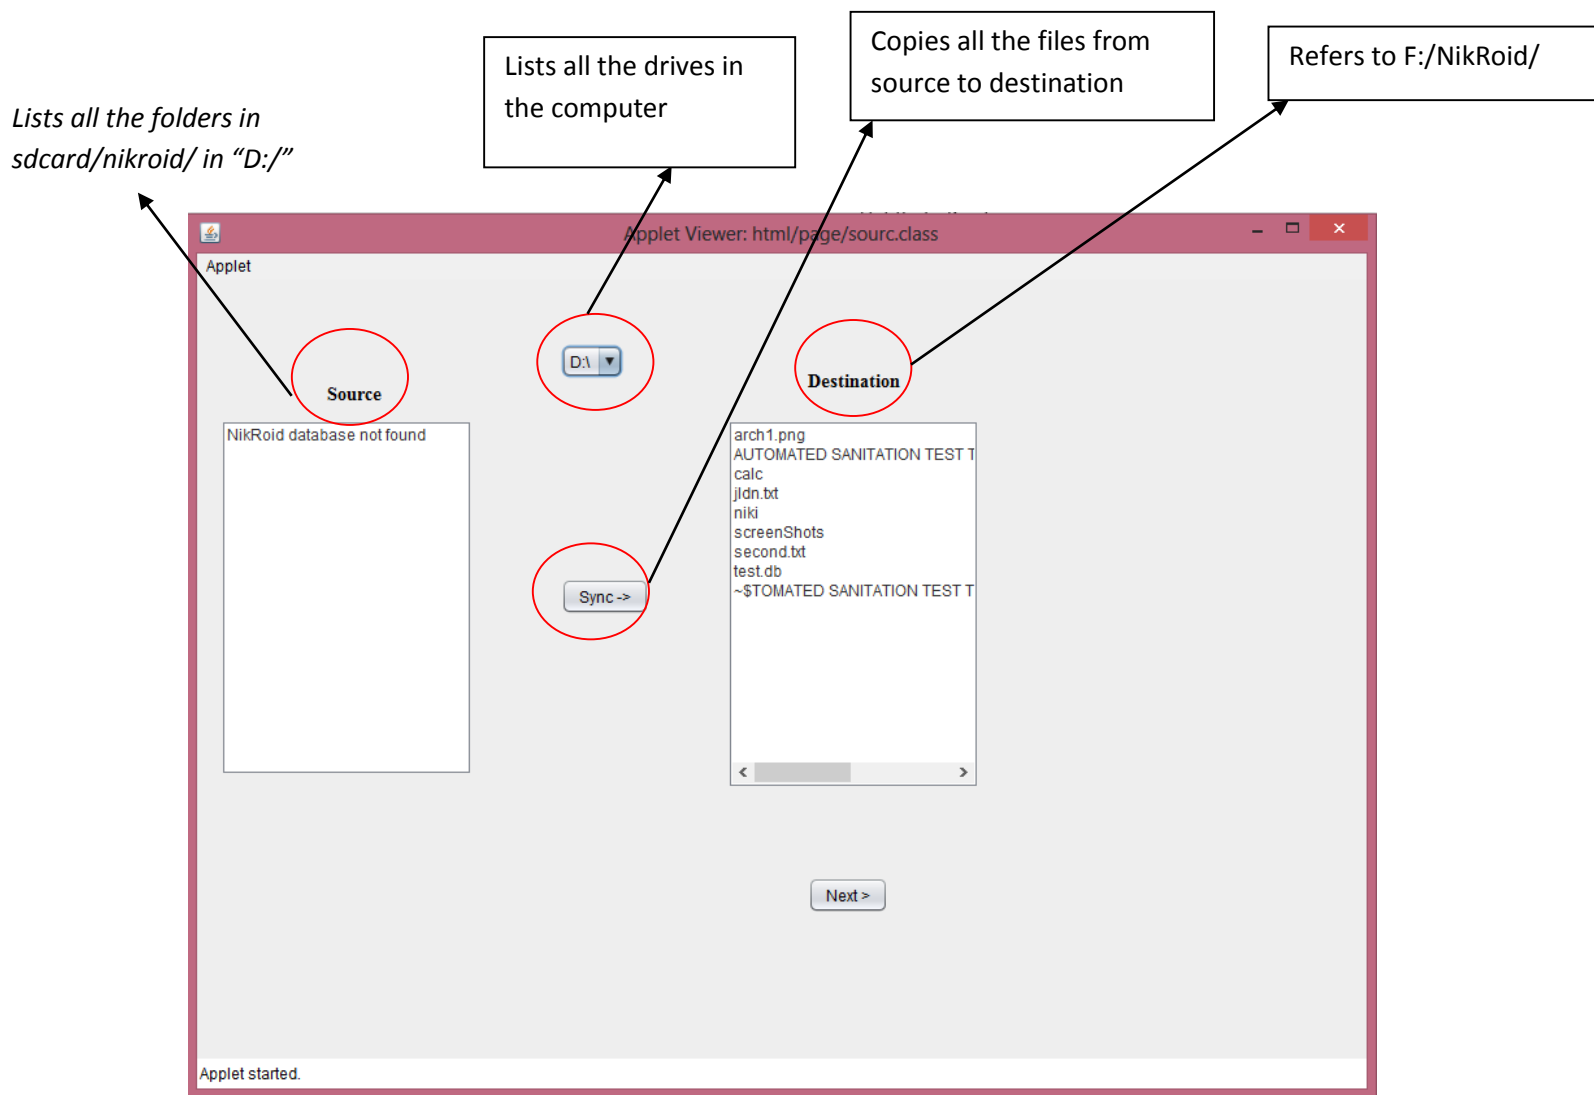

- It is an activity, will be invoked from logger service if any force closes encountered in system logs.
- This activity sends “log.txt” file containing system logs, to the email specified.

## Desktop Application:

This application is specifically designed to generate report from the databases exported from mobile application. For every application databases from <package-name>/ are extracted and generates report in the form of xls file and html page.

### Screen shots:-

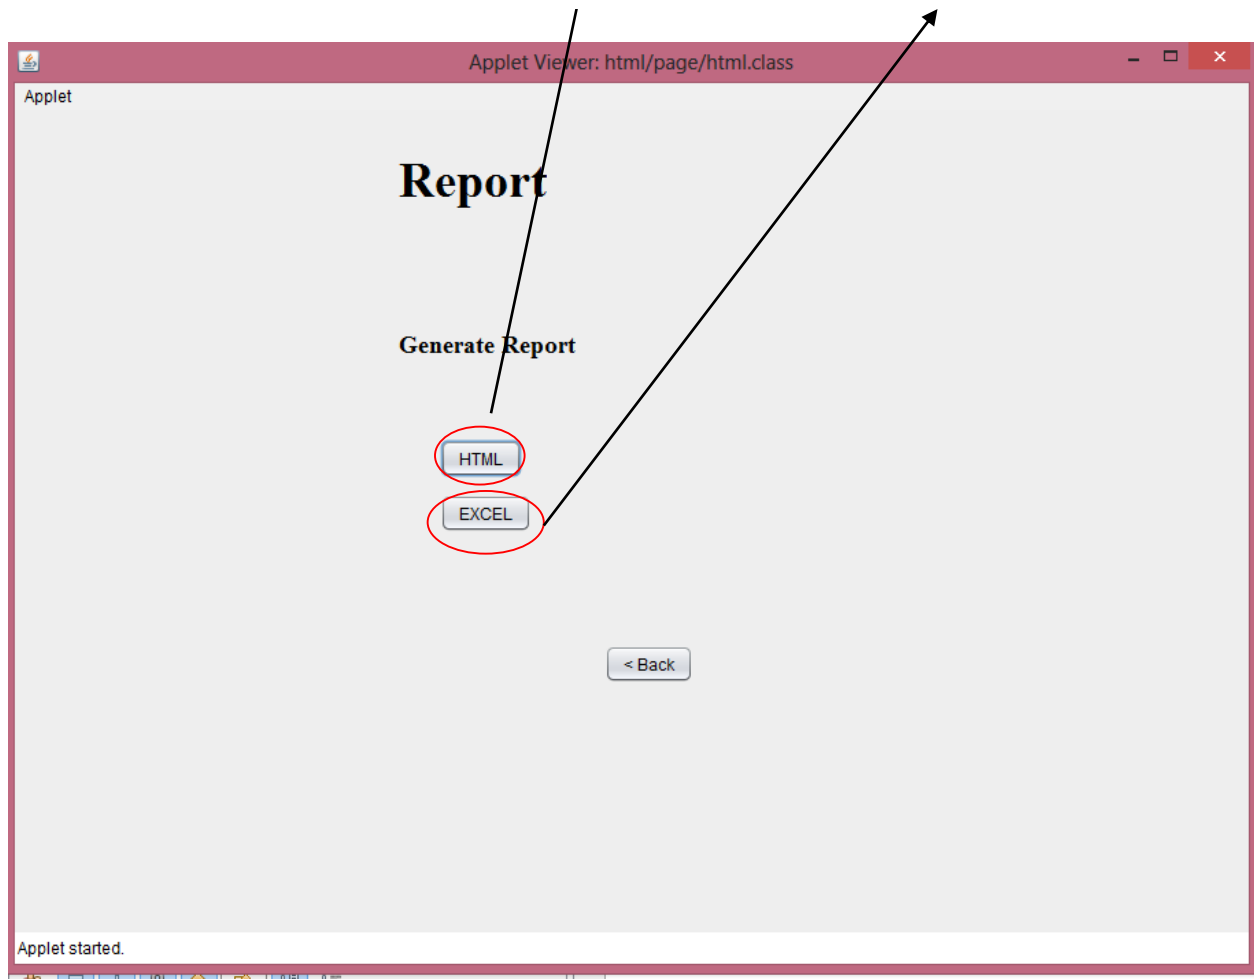

**[1] Sourc.java:-** Exports databases in sdcard/<project name> to desktop application.

[2]. **html.java:-** Uses apache-POI library to generate xls file programmatically and html file is also generated

This button creates  
F:/myHtml.html report

This button creates F:/new.xls report  
file

# Sample Report

Database 1

Input Type	X coordinate /key value	Y coordinate / 0	ScreenShot

Database 2

Input Type	X coordinate /key value	Y coordinate / 0	ScreenShot
